ABSTRACT

A system and method to provide a command sequence (101) to initiate a selection of a mood-ring. Such a method may permit the listing of available mood-rings (103) and highlighting (105) of a current or default mood-ring. Subsequent cursor movements (107) may be controlled by an input device. Detecting a signal to select (108) may, in fact, select a mood-ring such that further user-inputs may edit (109) aspects of that mood-ring. Any selection of a mood-ring may be followed by filtering (111) of received wireless messages, e.g. to admit messages from sources identified in a database of a mobile station.
